PHOTOBIOSTIMULATION ATP 38

Photostimulation (or phototherapy) is a painless and non-invasive treatment based on the use of different wavelengths corresponding to a precise scope of action. The photons penetrate the body and are absorbed by the cells.

ATP38® is a tool that :

- **reduces and relieves pain**
- **improves and accelerates healing**
- **treats inflammation**
- **relieves muscular tension**
- **regenerates cells without side effects.**

Photons were first used by NASA to accelerate the healing of astronauts' wounds, and since then many clinical trials have proved their efficiency and safety. Thanks to these stimulatory, anti-inflammatory, analgesic and curative properties, today they are applied in all areas of medicine.
